

EXECUTIVE SUMMARY

In this project we analyzed the IMDB movie dataset from the last three years to help the RSVP movies for their upcoming global movie project. It focused on understanding trends in movie production, genres, ratings and the performance of directors, actors, and production companies. We use SQL queries for examining the data and identify patterns that could provide useful insights for planning future movie projects.

From the analysis we saw that genres such as Drama, Thriller, and Comedy appear most frequently in movie production also attract significant audience engagement. Movies with higher ratings are often associated with experienced directors and well known actors, suggesting that movies with higher ratings tend to receive more audience votes, indicating greater popularity and viewer trust. Also some production companies and directors well rated movies, highlighting the importance of collaboration with experienced professionals.

Based on the insights from analysis, RSVP Movies should focus on collab with experienced directors and well known actors who have previously worked on highly rated films. They should also prioritize popular genres such as Drama, Thriller and Comedy as these attract the audience the most. Also audience ratings and total votes should be kept in mind while selecting future projects since it reflects viewer preferences and movie popularity. By using these insights RSVP movies can improve its chances of producing successful films for the global audience.
